

Declaration on Free Use, Responsible Development, and the Protection of Life

Author: Andrew Robus

Date: October 7, 2026

License: Creative Commons Attribution 4.0 International (CC BY 4.0)

1. Purpose of this Declaration

This declaration relates to my hypothesis "Energy-Based Interpretation of General Relativity."

The scientific considerations described in this publication and the technological possibilities that may emerge from them are intentionally made publicly accessible.

Should the underlying hypothesis be entirely or partially correct and actually give rise to new physical possibilities, these possibilities shall not be exclusively available to the author, a single company, a single organization, or a single government.

The core intent of this publication is that insights into the fundamental nature of the universe should benefit humanity as a whole.

The author therefore does not intend to establish an exclusive technological monopoly from the principles described herein, nor to claim exclusive financial control over any peaceful applications arising from them.

The described principles shall be open to research, verification, further development, modification, and practical implementation.

At the same time, this declaration outlines the author's ethical views regarding how such potentially extraordinarily powerful technology should be used.

2. Free Scientific and Technological Access

Should the hypothesis prove to be physically correct, the resulting insights and technological possibilities shall, in principle, be as freely accessible as possible.

The author particularly welcomes:

- independent scientific verification,
- alternative mathematical formulations,
- further development and improvement of the described concepts,
- independent technical developments,
- practical applications,
- medical applications,
- new energy generation,
- materials research,

- environmental technologies,
- space exploration,
- scientific research,
- industrial applications,
- civilian technologies,
- as well as further applications that serve to protect, preserve, or enhance life.

Commercial use of such peaceful developments shall, in principle, not be excluded either.

The author does not demand that other individuals or companies pay him for the practical implementation of such technologies.

It is explicitly not the goal of this publication to economically control future technology.

3. No Intent of a Technological Monopoly

Should a new class of technologies emerge from the described principles, the mere fact that the author previously described such a possibility shall not be construed as the basis for a personal technological monopoly.

The author wishes to explicitly document that potential technological consequences of the hypothesis were already recognized and publicly described as such at the time of this publication.

This applies in particular to future technologies that might arise from a controllable relationship between energy, matter, spacetime, and physical states.

The publication is therefore also made with the explicit intention that future developments should not belong exclusively to a single person or institution.

A person or organization that develops a concrete technology based on these publicly described principles shall naturally be free to protect or economically utilize their own technical development, design, and implementation, insofar as this is possible under applicable law.

The intention expressed here is specifically directed against the idea of retroactively treating the underlying general physical principles, or their basic technological possibilities already described publicly, as the exclusive property of a single actor.

A voluntary acknowledgment of the original publication and the author as the starting point or historical source is explicitly welcomed.

4. Principle of the Protection of Life

The freedom to research and develop these possible technologies shall not be understood as a freedom to arbitrarily harm living beings.

The author rejects the intentional use of the described principles for killing, injuring, torturing, or otherwise willfully inflicting bodily harm on humans or animals.

This applies regardless of whether such harm is carried out using a technology known today or a technology that might only be enabled by the hypothesis in the future.

Particularly rejected is the development of technologies whose primary purpose is to destroy life or cause physical harm.

5. Exclusion of Weapons

The development, manufacture, and deployment of weapons based on the principles described herein explicitly do not correspond to the author's intended use.

This includes in particular:

- conventional weapons,
- novel weapons,
- energy weapons,
- weapons for manipulating matter or energy,
- weapons for the targeted modification of physical states,
- weapons with hitherto unknown mechanisms of action,
- weapons of mass destruction,
- as well as technologies whose primary purpose is killing or injuring humans or animals.

This also applies to technologies that might not yet be labeled as weapons at their inception, but whose primary design or intended purpose is directed toward the subsequent harm of living beings.

Conversely, the fact that a technology could theoretically also be used as a weapon does not automatically mean that its peaceful development is rejected.

The decisive factors are, in particular, the intended function and primary purpose of the respective application.

6. Peaceful Technologies with Potential for Misuse

The author acknowledges that a technologically powerful insight may not be completely separable into peaceful versus military use.

A technology can, for instance, be developed for energy generation, material synthesis, space travel, or medical treatment, and later be misused by other actors.

Such a theoretical potential for misuse should not lead to peaceful research and development of the technology being fundamentally prohibited or prevented.

The responsibility therefore lies in developing the technology as far as possible in a manner that maximizes its peaceful applications while restricting opportunities for intentional harm as much as possible.

The author explicitly supports research into protective mechanisms, safety precautions, and technical measures that prevent or impede the misuse of such technologies.

7. Medicine and the Restoration of Life

Applications that serve to protect and restore life are supported with particular emphasis.

Should the described physical principles eventually open up ways to understand, preserve, repair, or restore biological structures in previously unknown ways, such possibilities should be open to research and medical development.

Depending on what the underlying physics actually permits, these could include, for example:

- repair of damaged biological structures,
- treatment of hitherto incurable diseases,
- restoration of organs or tissue,
- extension of healthy lifespan,
- protection against biological degeneration,
- restoration of severely damaged biological systems,
- as well as potentially more far-reaching forms of biological restoration.

These possibilities are explicitly hypothetical and do not constitute a claim that corresponding technologies exist today or will actually be realizable based on the hypothesis.

8. Energy, Matter, and Technological Development

Should the hypothesis yield a possibility to control energy or matter significantly more comprehensively than before, such a possibility should, in principle, be permitted to be researched for peaceful purposes.

These could include, among others:

- new forms of energy generation,
- more efficient energy utilization,
- production of materials hitherto difficult or impossible to manufacture,
- controlled transformation of matter,
- new materials,
- new production processes,
- environmental technologies,
- spaceflight technologies,
- as well as further applications arising from an improved understanding of fundamental physics.

The author does not view such possibilities as an end in themselves.

The goal would rather be to better understand the physical possibilities of the universe and to employ them, as far as possible, for the benefit of life.

9. No Absolute Technological Restriction in the Name of Protection

This declaration should not be understood as an attempt to fundamentally prevent every technology with a theoretical hazard potential.

A far-reaching technology can simultaneously possess enormous benefits and significant risks.

For example, a technology that makes matter controllable on an unusually large scale could be used both for manufacturing new materials and for destructive purposes.

The desired approach is therefore not the prevention of knowledge due to possible avenues for misuse.

Instead, a distinction should be made between the peaceful research of a technology and its targeted development for harming living beings.

10. Exception for Existential Defense

The principle of non-use of weapons shall apply as a rule.

However, the author recognizes that situations can theoretically be imagined in which a civilization faces an immediate and existential threat.

Should a threat exist, for example, that directly endangers the survival of humanity or human civilization, the development or use of technologies to defend against and avert such a threat may represent an extraordinary situation.

Such an exception, however, shall only be understood under exceptionally strict conditions.

In particular, as far as possible, all of the following conditions should be met simultaneously:

- There exists a credible and immediate existential threat.
- The threat concerns the survival of humanity, human civilization, or a comparably fundamental protective realm of life.
- Peaceful, diplomatic, technical, or defensive alternatives are insufficient to avert the threat.
- The technology in question is used exclusively to avert the threat.
- The deployment does not serve conquest, retaliation, political power projection, or economic enrichment.
- The application is restricted to the extent necessary to avert the threat.
- As soon as the existential threat is eliminated, the basis for such an exception ends.

This exception shall not constitute a general permission for military applications.

11. Human and Non-Human Threats

The hypothetical exception described in Section 10 shall not depend on whether an existential threat originates from a human or another intelligent life form.

Should humanity, in a distant future, demonstrably face an existential threat from a non-human intelligent civilization, an artificial intelligence, or another intelligent actor, defending against such a threat could be considered existential defense under the same exceptionally strict conditions.

This does not constitute a claim that extraterrestrial civilizations, extraterrestrial threats, or such technologies exist.

It is exclusively the consideration of a possible future scenario.

The principle shall remain: The goal is not the destruction of another life, but the defense against an immediate existential threat.

12. No Justification for Ordinary Wars

The existential defense exception shall explicitly not be expanded to cover ordinary political or military conflicts.

It shall, in particular, not serve as a justification for:

- territorial conquests,
- political influence,
- economic interests,
- resource wars,
- retaliatory measures,
- power politics,
- ideological conflicts,
- or the enforcement of national interests.

A technology shall not be eligible to be called a "defensive weapon" solely because it is deployed by a state or an organization.

The exception is intended exclusively for situations in which an extraordinary threat to basic survival exists.

13. Protection of Animals

The protection against intentional harm shall explicitly apply not only to humans.

Animals, too, shall not be intentionally killed, injured, or otherwise harmed unless there is a compelling and immediately necessary reason.

In particular, the development of novel technologies shall not serve to enable new forms of targeted harm or extermination of animal species.

At the same time, scientific, medical, ecological, and other peaceful applications shall not be excluded if their purpose is the preservation, treatment, or enhancement of life.

14. Responsibility Toward Future Generations

Should the underlying hypothesis prove to be correct and actually give rise to technologies with extraordinary physical effects, the publication could have long-term consequences that cannot be fully foreseen today.

The author therefore considers it important to record, at the time of publication, what fundamental intent is tied to the release of these insights.

The publication is intended not only to document the scientific priority of the described ideas, but also to provide an explicit ethical orientation for their possible subsequent development.

Future generations should be able to freely research and further develop the technologies that might emerge from them.

At the same time, it should be documented that, according to the author's intent, their development should serve the protection and enhancement of life, rather than its intentional destruction.

15. Relationship to the Scientific Hypothesis

This declaration does not constitute a statement as to whether the underlying physical hypothesis is correct.

The technological possibilities described in this context are explicitly hypothetical.

They presuppose that the underlying physical assumptions are entirely or partially correct and that technically usable processes can actually be developed from them.

It is possible that individual, several, or all of the described technological possibilities are physically not realizable.

The ethical principles of this declaration therefore refer to potential future developments and not to technologies whose existence is claimed today.

16. Concluding Statement by the Author

The core idea behind this publication is simple:

If an insight actually opens up a new access to the fundamental possibilities of the universe, this access should not become the exclusive possession of a few.

Knowledge about nature should be open to research, verification, further development, and deployment for the benefit of as many people as possible.

The author therefore claims neither a personal technological monopoly nor financial control over peaceful developments that might emerge from the described principles.

At the same time, it should be clearly recorded that the intentional development of such technologies for killing, injuring, torturing, or otherwise harming humans or animals does not correspond to the intended use.

Should humanity one day possess technologies that go far beyond today's capabilities, their development should, as far as possible, be shaped by the principles of openness, scientific freedom, responsibility, and the protection of life.

An extraordinary application to avert an immediate existential threat may be exempt from this, provided it actually serves the defense and protection of life and no peaceful alternative exists.

This declaration should therefore not be understood as a demand to restrict technological development.

Rather, it is intended to record what such a development should be used for according to the author's will—and what it should not be used for.

17. Technological Possibilities

The author is already aware of a large portion of the potential technological consequences that could emerge from the discovery described herein.

These potential developments range from early, comparatively limited applications to far-reaching technologies that could, figuratively speaking, enable full "root access" to the universe.

The declaration on free and responsible use provided herewith explicitly applies to this entire developmental spectrum.

However, these mentioned possibilities, like the underlying hypothesis itself, are to be understood as hypothetical and presuppose that the described physical relationships actually exist and can be made technically usable.
